

WINDOW FUNCTIONS

GROUP BY → Summarising Data

Q. Get the price of the most expensive item per vendor. ✓

```
SELECT  
  vendor-id,  
  MAX (original-price) ←
```

```
FROM vendor-inventory  
GROUP BY vendor-id.
```

New Q.

Q. Rank the products in each vendor's inventory. Expensive products should get lower rank. ✓

Window Functions

Vendor - Based Analysis

① \hookrightarrow Avg. price per product
per vendor.

② \rightarrow How many products of each vendor is greater than the avg. price of products in the market

PART 1

| R-Number | product id | v-id | original-price | Avg. | Rank |
|----------|------------|-------|----------------|------|------|
| 1 | 1 | [1] ✓ | 5 | 5.6 | ↓ |
| 2 | 2 | | 6 | 5.6 | |
| 3 | 3 | | 4 | 5.6 | |
| 1 | 1 | [2] ✓ | 6 | 5.6 | |
| 2 | 2 | | 8 | 5.6 | |
| 3 | 3 | | 5 | 5.6 | |

Annotations: Arrows point from the 'v-id' column to the 'original-price' column. In the 'original-price' column, the values 5, 6, and 4 are grouped by a bracket and an arrow points to the 'Avg.' column value 5.6. Similarly, the values 6, 8, and 5 are grouped by a bracket and an arrow points to the 'Avg.' column value 5.6. The 'Rank' column has a downward arrow.

WINDOW Fn.

\rightarrow Partitions

Syntax:

SELECT

→ ROW-NUMBER() OVER (PARTITION
BY vendor-id
ORDER BY original-price)
AS

FROM

WHERE

⋮

Q. As a farmer, you want to figure out which
of your products were above the avg.
→ price of products on each market
date.

| | ↓ | | | | |
|-----|------|------|------|-------|------|
| | date | v-id | p-id | price | avg. |
| [→ | 21 | 1 | 1 | 3 | 3 |
| | 21 | 1 | 2 | 4 | 3 |
| | 21 | 1 | 3 | 3 | 3 |
| | 21 | 2 | 10 | 2 | 3 |
| | 21 | | | | |

Q. Count how many different products each
vendor brought to the market on
each date and display the count

on each row.

✓ $\text{COUNT}(\text{DISTINCT product_id}) \text{ OVER } (\text{PARTITION BY market_date, vendor_id})$

RANGE → Logical frames
